Abstract

The Revised Conflict Tactics Scale--Modified (Edwards & Sylaska, 2016) was developed within the context of a study of intimate partner violence (IPV) and minority stress research. Participants were 277 U.S. emerging adults (aged 18 to 25 years) currently involved in same-sex relationships. Items from the Revised Conflict Tactics Scale (CTS2; Straus et al., 1996) were used to assess for the presence of Physical (12 items), Sexual (5 items), and Psychological (4 items) IPV victimization and perpetration in current relationships. Only severe psychological items were utilized, given that moderate items on the CTS2 may reflect more normative conflict resolution within dating relationships rather than psychological abuse (Shorey, Cornelius, & Bell, 2011). Respondents indicated the number of times they had experienced and performed each behavior from 0 (Never) to 6 (More than 20 times) in the context of their current relationship. The authors included 2 additional items in both victimization and perpetration formats to tap into types of IPV that may be specific to sexual minority individuals, i.e., anti-gay slurs and outing. Psychometric properties were not reported at the time of test development. (PsycTESTS Database Record (c) 2016 APA, all rights reserved)

Details

Construct Intimate Partner Violence

Classification 7800: Trauma, Stress, and Coping

Purpose The Revised Conflict Tactics Scale--Modified is used to

measure the frequency of physical, sexual, and

psychological intimate partner violence victimization and

perpetration in lesbian and gay relationships.

Format The 23 items are answered using a scale from 0 (Never) to

6 (More than 20 times).
